

Date: 2026-04-27

1) GitHub reflection status

- Local edits are NOT on GitHub until push.
- Flow: edit -> test -> git commit -> git push -> PR merge.

2) Why changes were made

- Reproducibility: clear README and CLI examples.
- Stability: packaging entry points and headless OpenCV.
- Safety net: smoke tests for review/feature/export logic.

3) Methodology used

- Small, reviewable commits.
- No heavy model/GPU requirement for tests.
- Backward compatibility for session decisions format.

4) Basics to study next

- Python packaging: pyproject.toml, console scripts.
- JSON schema thinking for research pipelines.
- Unit tests with pytest + mocking CLI args.

5) Practical application

- For each future code change, produce a separate PDF:
intent, approach, basic concepts, and exercises.
- Keep this PDF outside source modules (guides/).
